Hypervisor Project

Purpose and Rationale

The Hypervisor Project follows after two successful workshops at the last two GENIVI All-Member-Meetings and investigates the wide scope of open-source and commercial hypervisor technologies, and addresses challenges in their use. Through collaboration between all vendors, experts, and adopters of virtualization technology, we can lower the barriers to successful product development. The project drives requirements, standardization for Hypervisor APIs, and other types of investigations to facilitate ECU consolidation, price reduction, and management of mixed-criticality in systems for improved security and functional safety.

You can look below for detailed backlog and topics, but to summarize there are three primary work streams currently in development:

1. Virtual Device API standardization, leading to the definition of the Automotive standard Virtual Platform (this naturally builds on existing standards like VIRTIO)
2. Multi-OS system design on Multi-Core SoCs (with/without virtualisation)
3. Investigate and recommend electrical/software architecture for automotive use-cases, when deployed using virtual-machine technologies.

Next Meeting

🌟 Monday, February 24, 10:00 AM CE(S)T

Agenda:
- Webinar "debrief"
- Check progress on whitepaper
- JIRA tickets

General backlog
- Work on next release of platform definition
- Look at active sprint & backlog of HV tracker
- HV - Webinar plan

Zoom Meeting details:
- Registration link (if you do it before, it saves time)
- Join link
- Meeting password: hvws

Meeting Minutes (use link)

Events / F2F

2019 GENIVI Tech Summit in November (completed)
- Time/Location: 12-13 November, Troy near Detroit, Michigan, USA.
- INFORMATION AND REGISTRATION
- Planning an update on the results of the Hypervisor Project, and an interactive Q&A / discussion session.

F2F Meeting (completed)
- Dates: 24-25 September 2019 (Tuesday, Wednesday)
- Location: Opensynergy, Berlin, Germany
  - directions: to be added
  - hotel recommendations: to be added
- Agenda: Hypervisor Project F2F meeting 20190924-25

Backlog (Topic List)

🌟 Review / check consensus on USB chapter of specification + other minor edits (Artem to come back with new info)
- AI/Tensor processing, on GPU or other dedicated hardware
- Deep-dive Memory Buffer sharing (GPU) - invite Eugen Friedrich
- Update Milestones, deliverables, and workplan.
- (started, needs input again) Use cases, architectures and requirements workstream
- Some was added to the AGL publication on virtualization after our most recent review. Re-review, to identify useful/reusable parts. Links at the bottom.
Original sub-topics (Possible focus areas)

- APIs for security: Mandatory Access Control features (in virtualization environments, that is)
- VM management tool
- Instrumentation & tools
- Safety compliance: ISO26262
- Security compliance: Common Criteria, EAL
- System design to optimize Boot Time,
- Boot requirements, e.g. secure boot, integrity check,
- Agree on Terms / Nomenclature

Mailing list & Contribution

1. Discussion should use the general genivi-projects mailing list. Start the subject line using: [HVWS]
2. The Wiki is an open public collaboration area. Please contribute/improve it as needed. Improve text, add relate info, links, references!
3. To edit the Wiki, log in or request an account.
4. Any other process question? - you can contact the acting project lead: Gunnar Andersson

Done / skipped / no longer on backlog

- Reactions to Samsung presentation
- Reference implementation: Should be based on which hypervisor(s)?
  - Answer: All are welcome. The companies that do the development will in practice affect the choice(s).

Project Pages summary

- [HV] Next Generation Multi-OS System Design Whitepaper
- HV - Webinar plan
- HVWS - Watchdog
- HVWS Workshop Schedule at Bangalore Tech Summit
- Hypervisor in Automotive - Critical Use cases
- Hypervisor Project - minutes
- Hypervisor Workshop Schedule at Munich AMM 2018
- Hypervisor Workshop Schedule at Munich AMM 2019
- Participation in Hypervisor Project
- Principles of meta/delta-specification (formal specification with reference/reuse)
- Virtual Platform definition for Automotive Hypervisor Environments

Topic Introduction:
Virtual Device standardization, a.k.a. Automotive Virtual Platform definition

Define common I/O devices for hypervisor guests with standardized features and interface, such that device drivers (and as a consequences systems, virtual-machines) become more portable.

Advantages:

- Device drivers (for paravirtualization) for the (Linux*) kernel don't need to be maintained uniquely for different hypervisors
- Ability to move hypervisor guests between different hypervisor environments
- Define potential for shared experience and getting the right functionality into the APIs.
  - Heterogeneous cross-system testing will strengthen specs and implementation.
- Some potential for shared device driver implementation across hypervisors (dependent on licenses - open-source, closed-source)

*virtio also supported by BSD, Windows, Fuchsia, and others

Extending this: Standardizing a contract/standard between guest and hypervisor. Compare the OCI initiatives for containers. Container runtimes can we have standardized "hypervisor runtime environment" that allows a standards compliant virtual (guest) machine to run.

- Hypervisors can fulfill the specification (with local optimizations / advantages)
- Similarly, this specification is what guests can be engineered to.

Compare: Linux Device Tree – ability to discover and configure devices.

The work is documented here
